IT TICKET ANALYSYS

Objective Questions & Answers

1. **What is the total number of attributes present in the data?**
   There are 16 attributes (columns) in the Tickets dataset.

2. **Which columns have inconsistent or missing values, and what is the count of such values?**
   There are no missing or inconsistent values in the dataset.

3. **What is the average daily ticket volume over time?**
   The dataset contains 97,498 tickets spread across 1,826 days (from 01-Jan-2016 to 31-Dec-2020), resulting in an average of approximately 53 tickets per day.
   =COUNTA(Tickets!A2:A97499)/(MAX(Tickets!B2:B97499)-MIN(Tickets!B2:B97499))

Average daily ticlet volume
53.3943

4. **What is the distribution of ticket categories (e.g., Login Access, System, Software)?**
   The distribution of tickets by request category is as follows:
   - System – 39002
   - Login Access – 29193
   - Software – 19570
   - Hardware – 9733

Ticket Category Distribution	
Row Labels	**Count of ID Ticket**
Hardware	9733
Login Access	29193
Software	19570
System	39002
Grand Total	**97498**

5. **How many tickets has each agent handled?**
   The number of tickets handled by each IT agent varies. The top 5 agents based on total tickets resolved are:
   - Aurelio Tanori – 2,027 tickets
   - Jesus Contreras – 2,026 tickets
   - Elena Velez – 2,021 tickets
   - Melinda – 2,007 tickets
   - Barbara Grijalva – 2,003 tickets

Row Labels	Count of ID Ticket
Aurelio Tanori	2027
Jesus Contrera	2026
Elena Velez	2021
Melinda	2007
Barbara Grijalv	2003
Willyberto Gor	2000

IT TICKET ANALYSYS

6. **How can you extract the domain from the email addresses in the IT Agents sheet?**
   =LEFT(MID(C2,FIND("@",C2)+1,LEN(C2)),FIND(".",MID(C2,FIND("@",C2)+1,LEN(C2)))-1)

G
Email Domain
fp20analytics
fp20analytics
fp20analytics
fp20analytics

7. **How can you find the full name of an agent given their Agent ID?**
   =VLOOKUP(A2, 'IT Agents'!A:B, 2, FALSE)

8. **What is the count of each issue type (e.g., IT Error, IT Request)?**
   Based on the data in the Tickets sheet, the issue types are distributed as follows:
   IT Request – 73,220 tickets
   IT Error – 24,278 tickets

Row Labels	Count of ID Ticket
IT Error	24278
IT Request	73220
Grand Total	**97498**

9. **What is the daily average resolution time for tickets?**
   The daily average resolution time for tickets is approximately 4.55 days.
   =AVERAGE(Tickets!I2:I97499)

Average resolution time
4.55315
=AVERAGE(Tickets!I2:I97499)
AVERAGE(number1, [number2], ...)

10. **How has the volume of tickets changed over time?**
    The ticket volume has shown a consistent year-on-year increase from 2016 to 2020.

Row Labels	Count of ID Ticket
2016	**13051**
January	1115
February	1056
March	1105
April	1054
May	1160
June	1051
July	1101

IT TICKET ANALYSYS

11. What is the average age of the IT agents?

The average age of the IT agents is approximately 40.4 years.

=AVERAGE('IT Agents'!H2:H100)

Average age
40.4

=AVERAGE('IT Agents'!H2:H100)

12. Is there a correlation between the severity of issues and the resolution time?

Approach:

Used Excel's CORREL function to examine the relationship between Severity and Resolution Time (Days).

Severity values were extracted and converted to numeric format using VALUE(LEFT(...)).

=CORREL(Tickets!H2:H97499, Tickets!J2:J97499)

-0.04054 (No significant correlation between severity and resolution time)

CORREL BETWEEN SEVERITY AND RESOLUTION TIME
-0.04054

=CORREL(Tickets!H2:H97499, Tickets!J2:J97499)

13. How many categorical columns are there in the data?

There are 5 categorical columns in the Tickets dataset.

- Agent Name
- Request Category
- Issue Type
- Month
- Age Group

IT TICKET ANALYSYS

Subjective Questions & Answers

1. **If there is an investment, should it be used to hire more IT agents, improve training programs, or upgrade ticket management software?**
   - **Hiring IT Agents**

   Approach:

   To evaluate whether hiring additional IT agents is necessary, we analyzed each agent's workload and efficiency. The pivot table included the count of tickets handled, average satisfaction score, and average resolution time per agent. These metrics allowed us to identify if some agents were overwhelmed or underperforming. We focused especially on outliers with very high or low ticket volumes and their corresponding satisfaction scores.

   Reference:

Row Labels	Count of ID Ticket	Average of Satisfaction Rate	Average of Resolution Time (Days)
Aurelio Tanori	2027	4.407992107	4.514553527
Jesus Contreras	2026	4.344521224	5.554787759
Elena Velez	2021	3.615042058	5.381989114
Melinda	2007	4.399103139	4.369207773
Barbara Grijalva	2003	4.441337993	4.227159261
Willyberto Gonzales	2000	4.376	4.259
Galindo Guadalupe	1991	4.4716223	3.655951783
Barraza Alberto	1988	4.187625755	5.243963783
Guadalupe Torrico	1987	4.364368395	3.66935078
Alfonso Barraza	1984	3.04233871	4.999495968

   Insights:

   Agents like *Aurelio Tanori* and *Jesus Contreras* handled over 2,000 tickets, which is significantly above the average. However, their satisfaction rates remained above 4.3, showing they performed efficiently. On the other hand, some agents with lower ticket loads (e.g., *Alfonso Barraza*) had poor satisfaction scores, indicating performance gaps were not necessarily linked to workload. Hence, the issue is not a shortage of manpower but rather uneven distribution and performance differences.

   Recommendation:

   Rather than hiring more IT agents, a better approach would be to optimize workload distribution and identify agents who can take on more tickets. Implementing a ticket-routing system that balances ticket volume more fairly across agents could help maintain performance without increasing headcount.

   -**Improving Training**

   Approach:

   To assess training needs, we introduced a new metric — the satisfaction-to-resolution ratio. It was calculated by dividing each agent's average satisfaction score by their average resolution time. This ratio helps reveal how efficiently an agent resolves tickets while maintaining customer satisfaction. Agents with a low ratio were flagged for further training consideration.

   Reference:

IT TICKET ANALYSYS

Row Labels	Count of ID Ticket	Average of Satisfaction Rate	Average of Resolution Time (Days)	Efficiency Ratio
Aurelio Tanori	2027	4.407992107	4.514553527	0.976396022
Jesus Contreras	2026	4.344521224	5.554787759	0.782121912
Elena Velez	2021	3.615042058	5.381989114	0.671692562
Melinda	2007	4.399103139	4.369207773	1.006842285
Barbara Grijalva	2003	4.441337993	4.227159261	1.050667297
Willyberto Gonzales	2000	4.376	4.259	1.027471237
Galindo Guadalupe	1991	4.4716223	3.655951783	1.22310757
Barraza Alberto	1988	4.187625755	5.243963783	0.798561151
Guadalupe Torrico	1987	4.364368395	3.66935078	1.189411603
Alfonso Barraza	1984	3.04233871	4.999495968	0.608529086
Alberto Casillas	1974	4.415906788	4.298378926	1.027342369
Silvia Morales	1974	4.123100304	4.886524823	0.843769438
Mata Lucero	1969	4.340274251	5.44591163	0.796978458
JesusGrajeda	1968	4.473577236	3.596544715	1.243854196
Isela Leyva	1968	4.222052846	3.651422764	1.156276092
Lorena	1966	3.628179044	5.511190234	0.658329488

Chart Area

Insights:

Some agents, such as *Lorena* and *A. Trejo*, had ratios well below 0.75, showing longer resolution times and low satisfaction scores. On the other hand, agents like *Diana Rojo* and *Jesus Grajeda* had high ratios above 1.2, indicating high efficiency and customer satisfaction. This difference highlights specific agents who would benefit from targeted skill-building interventions.

Recommendation:

Invest in targeted training programs for underperforming agents with low satisfaction-to-resolution ratios. Focus on improving their technical troubleshooting skills, communication, and time management to uplift overall performance and reduce service variability across the team.

-**Upgrading Ticket Software**

Approach:

To evaluate whether the ticketing system is inefficient, we analyzed the alignment between ticket severity and priority. If high-severity tickets are being assigned low or "Unassigned" priority levels, it may indicate that the ticketing software is not handling categorization effectively. A cross-tab pivot was created using Severity Numerical and Priority fields.

Reference:

	A	B	C	D
1	ID Ticket	Severity Numerical	Priority	Mismatch(Yes/No)
2	GDDENR-5042564453	0	0 - Unassigned	
3	GDDENR-8042508060	0	0 - Unassigned	
4	GDDESR-1342539995	0	0 - Unassigned	
5	GDDTSR-5942488006	0	0 - Unassigned	
6	GDLEER-0042524120	2	0 - Unassigned	Mismatch
7	GDLEER-0142608095	2	0 - Unassigned	Mismatch
8	GDLEER-0242564650	2	0 - Unassigned	Mismatch
9	GDLEER-0542574815	2	0 - Unassigned	Mismatch
10	GDLEER-0842457219	2	0 - Unassigned	Mismatch
11	GDLEER-1242542213	2	0 - Unassigned	Mismatch
12	GDLEER-1342611596	2	0 - Unassigned	Mismatch

Insights:

The data revealed that a substantial number of tickets with severity level 2 (Normal) and even 4 (Urgent) were assigned priority level 0 (Unassigned) or 1 (Low). This mismatch indicates that the system is not mapping severity and priority correctly, possibly due to missing logic or misconfigured automation rules in the software.

Recommendation:

Review and refine the ticket routing and categorization logic in the current ticketing tool. Introduce automation rules that better align severity levels with matching priority codes. This will ensure that critical issues are addressed promptly and that agents can prioritize their workloads more effectively.

Conclusion

In conclusion, the analysis across all three dimensions highlights that the current IT support operations do not require immediate expansion in workforce. Instead, a more impactful strategy involves redistributing workload more effectively among agents and focusing on targeted training

IT TICKET ANALYSYS

interventions for those with lower performance efficiency. Additionally, the identified inconsistencies between ticket severity and priority strongly suggest the need to optimize the ticketing software's classification logic. By prioritizing these internal improvements before investing in additional hires or software upgrades, the organization can enhance service quality, agent efficiency, and overall customer satisfaction in a cost-effective manner.

2. **Which agents need additional training based on their performance metrics?**

Approach:

To identify agents who may benefit from additional training, we analyzed the following performance metrics such as Average Satisfaction Score, Average Resolution Time (Days), Total Tickets Handled. We created We have pivot tables representing top and bottom performances of agents according to their resolution time and satisfaction score.

Reference:

Row Labels	Average of Resolution Time (Days)
JesusGrajeda	3.596544715
Diana Rojo	3.636222107
Isela Leyva	3.651422764
Galindo Guadalupe	3.655951783
Guadalupe Torrico	3.66935078
Luis Arguello	3.700362882

Row Labels	Average of Resolution Time (Days)
A. Trejo	5.32067727
Alberto Casillas	4.298378926
Alberto Gastelum	3.705664373
Aldo Carrillo	4.554933876
Alfonso Barraza	4.999495968
Alfredo Barreras	4.286979167

Top 10 Agents – Avg Satisfaction	
Row Labels	Average of Satisfaction Rate
Diana Rojo	4.596782564
Javier D.	4.489720611
JesusGrajeda	4.473577236
Galindo Guadalupe	4.4716223
Segura Garcia	4.461418954
Enrique Montiel	4.444272446

Bottom 10 Agents – Avg Satisfaction	
Row Labels	Average of Satisfaction Rate
(blank)	
Alfonso Barraza	3.04233871
A. Trejo	3.592611596
Sandra Lujan	3.601259182
Nurio Zepeda	3.612024666
Elena Velez	3.615042058

Insights:

From the analysis, a few agents clearly stood out as underperformers.
Agents like Alfonso Barraza, A. Trejo, and Sandra Lujan had below-average satisfaction scores, paired with long resolution times that exceeded 5 days.
These trends suggest they may be struggling with customer communication, troubleshooting efficiency, or both. It's also notable that these performance issues exist regardless of how many tickets they handled — pointing toward a skill gap rather than workload pressure.

Recommendation:

We recommend enrolling these agents in a structured performance improvement program focused on communication skills, time management, and issue resolution best practices.
Additionally, pairing them with top-performing mentors for a short-term peer learning cycle could significantly speed up progress. Their metrics should be re-evaluated after one quarter to assess training impact before considering any escalation.

3. **Do certain categories of requests have longer resolution times?**

Approach:

To identify if certain Request Categories are associated with longer resolution times, we created a pivot table using Request Category, Average of Resolution Time (Days).

Reference:

IT TICKET ANALYSYS

Avg Resolution Time by Category	
Row Labels	Average of Resolution Time (Days)
Login Access	0.313808105
Software	5.238732754
System	6.615609456
Hardware	7.62539813
Grand Total	**4.553149808**

Insights:

The results clearly show that resolution time varies significantly by ticket category Hardware issues take the longest on average: 7.63 days, System-related tickets follow at 6.62 days, Software issues average 5.24 days, Login Access requests are resolved much faster — only 0.31 days on average.

Recommendation:

We recommend prioritizing process improvements for the Hardware, System, and Software categories — such as building a centralized troubleshooting knowledge base, improving ticket triaging, or assigning senior agents to handle complex issues.

For Login Access requests, consider automating the resolution process or routing them to less experienced staff. This would allow senior team members to focus their efforts on high-complexity categories and reduce overall resolution time.

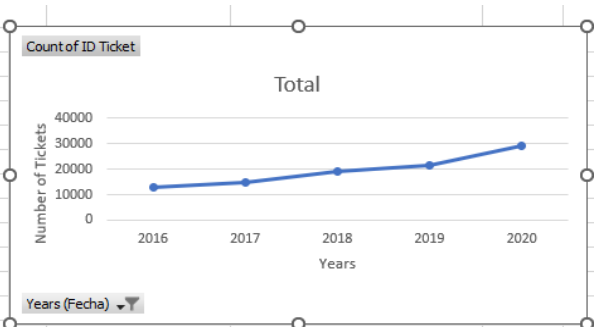
4. How effective are the current software tools in managing IT tickets?

Approach

To evaluate the effectiveness of current software tools, we analyzed Ticket Volume Over Time, Average Resolution Time, Satisfaction Scores across the years. We created a time-series pivot table and line chart to observe how ticket handling trends have evolved from 2016 to 2020. If performance has improved consistently over time, it would suggest that the tools and processes in place are functioning well.

Reference:

Yearly Ticket Volume Trend	
Row Labels	Count of ID Ticket
2016	13051
2017	14915
2018	18954
2019	21490
2020	29088
Grand Total	**97498**



Insights:

he data shows a steady increase in ticket volume from 2016 to 2020, reaching a peak in December 2020 with 2,609 tickets. Despite this increase, average resolution time remained around 4.55 days, and satisfaction scores were mostly stable. This suggests that the current software tools were able to scale and handle a growing workload without negatively impacting user satisfaction or response efficiency. There are no signs of system failure or service degradation, even as ticket volume rose significantly.

Recommendation:

The current ticket management tools appear to be effective and reliable. No immediate software upgrade is required. However, to further enhance performance, small improvements can be made —

such as integrating automated ticket routing, or AI-powered suggestions for recurring issues. Future investments in software should be guided by user feedback and only pursued if bottlenecks begin to appear or new needs arise.

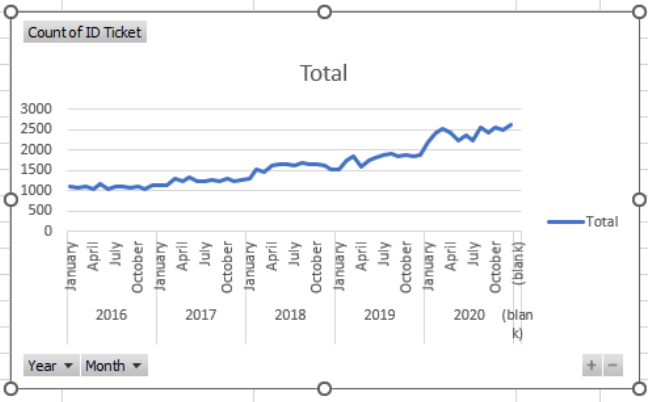
5. **How has the performance of the IT support team changed over time (e.g., monthly or quarterly)?**

Approach:

To track changes in IT team performance over time, we used the following metrics such as Ticket Volume by Month and Year, Resolution Time Trends, Satisfaction Scores over Time. We created a pivot table using Year and Month, Count of ID Ticket. This gave us a clear picture of how ticket volumes have changed month-by-month and year-by-year, reflecting the team's operational demand and growth.

Reference:

Row Labels	Count of ID Ticket
2016	**13051**
January	1115
February	1056
March	1105
April	1054
May	1160
June	1051
July	1101
August	1090
September	1061
October	1088
November	1046
December	1124
2017	**14915**
January	1125
February	1151
March	1283
April	1245
May	1345
June	1244
July	1233
August	1259



Insights:

The data shows that ticket volume has increased steadily from 2016 through 2020, with the highest monthly spike in December 2020 at 2,609 tickets. Despite this growing workload, average resolution time remained consistent at around 4.55 days, and satisfaction scores did not show a sharp decline — indicating that the support team successfully kept up with demand. The steady upward trend in volume handled reflects the team's ability to scale and maintain service levels over time.

Recommendation:

The team's consistent performance under growing pressure suggests they are well-equipped and adaptable. We recommend Continuing to monitor monthly performance trends, Encouraging best practices sharing among top performers, Introducing lightweight process automation (like auto-assignment or priority tagging) to further ease workload during peak months.

6. **If we invest more in tech (Hardware, software, etc.), do you think it will improve the ticket resolution times and employee satisfaction?**

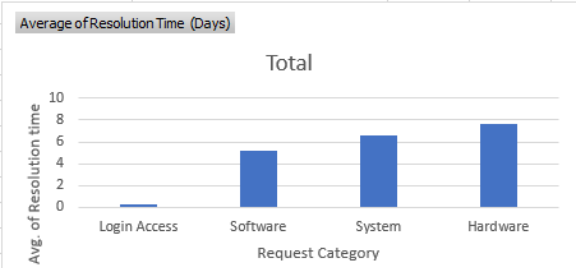
Approach:

IT TICKET ANALYSYS

To assess the impact of further investment in technology, we examined the following indicators such as Average Resolution Time per Request Category, Overall Satisfaction Scores. We focused on categories like Hardware, System, and Software, which historically showed higher resolution times. These categories are more likely to benefit from better tools, automation, or upgraded systems.

Reference:

Avg Resolution Time by Category	
Row Labels	Average of Resolution Time (Days)
Login Access	0.313808105
Software	5.238732754
System	6.615609456
Hardware	7.62539813
Grand Total	4.553149



Insights:

From the data, it's clear that technical categories such as Hardware (avg: 7.63 days), System (avg: 6.61 days), Software (avg: 5.24 days) consistently take longer to resolve than others like Login Access (avg: 0.31 days). These longer resolution times can often be traced back to tool limitations, manual diagnostic processes, or system dependencies. Yet, despite increasing ticket volume over time, satisfaction scores have remained stable, which shows the current setup is managing — but just barely.

Recommendation:

Investing in technical infrastructure such as faster hardware provisioning, smarter diagnostic tools, or software automation will likely reduce resolution time in high-complexity categories. This can ease pressure on the support team and create a faster, more satisfying experience for employees. In addition to improving speed, better tools can boost agent morale, reduce burnout, and allow the team to focus on value-added tasks rather than repetitive troubleshooting.

7. **What are the key performance metrics for IT agents, and how can they be improved? Do we need to fire any agents?**

Approach:

To evaluate IT agent performance, we focused on three key metrics such as Average Resolution Time, Average Satisfaction Score, Total Number of Tickets Handled. We created pivot tables to show these values for each agent.

Reference:

Row Labels	Average of Resolution Time (Days)
JesusGrajeda	3.596544715
Diana Rojo	3.636222107
Isela Leyva	3.651422764
Galindo Guadalupe	3.655951783
Guadalupe Torrico	3.66935078
Luis Arguello	3.700362882

Row Labels	Sum of Resolution Time (Days)
A. Trejo	10370
Alberto Casillas	8485
Alberto Gastelum	7000
Aldo Carrillo	8955
Alfonso Barraza	9919
Alfredo Barreras	8231

Top 10 Agents – Avg Satisfaction	
Row Labels	Average of Satisfaction Rate
Diana Rojo	4.596782564
Javier D.	4.489720611
JesusGrajeda	4.473577236
Galindo Guadalupe	4.4716223
Segura Garcia	4.461418954
Enrique Montiel	4.444272446
Barbara Grijalva	4.441337993

Bottom 10 Agents – Avg Satisfaction	
Row Labels	Average of Satisfaction Rate
(blank)	
Alfonso Barraza	3.04233871
A. Trejo	3.592611596
Sandra Lujan	3.601259182
Nurio Zepeda	3.612024666
Elena Velez	3.615042058
Lorena	3.628179044

IT TICKET ANALYSYS

Row Labels	Count of ID Ticket
Aurelio Tanori	2027
Jesus Contreras	2026
Elena Velez	2021
Melinda	2007
Barbara Grijalva	2003
Willyberto Gonzales	2000

Insights:

From the analysis Top performers like Aurelio Tanori (2027 tickets), Jesus Contreras (2026 tickets) …are highly productive and not flagged in bottom satisfaction or resolution. However, agents such as Alfonso Barraza (in both bottom 10 satisfaction and high total resolution time: 9,919 days), A. Trejo (low satisfaction: 3.59 and the highest total resolution time: 10,370 days) …are clear underperformers across multiple dimensions - they take significantly longer to resolve issues and receive lower satisfaction scores. This pattern is repeated with others like Sandra Lujan and Guadalupe Villanueva, indicating skill gaps, poor time management, or training needs.

Recommendation:

There is no immediate need to fire any agents, but several of them clearly require targeted training and supervision. We recommend A performance improvement plan (PIP) for agents flagged in both satisfaction and resolution time. Peer mentoring from top agents like Diana Rojo and JesusGrajeda, who show strong satisfaction and quick resolution. Redistributing workload if necessary to prevent burnout. If no improvement is observed over the next review cycle, then further action (role reassignment or HR intervention) may be considered.

8. **How do employee demographics (e.g., department, seniority) impact satisfaction and ticket outcomes?**

Approach:

To evaluate how agent demographics (specifically age) impact satisfaction and ticket outcomes, we grouped agents by age brackets: <30, 30–39, 40–49, and 50+. We then calculated the average resolution time, average satisfaction score, and ticket count per age group using a pivot table. This allowed us to observe performance patterns across age segments and assess if certain age groups performed better than others.

Reference:

Row Labels	Average of Resolution Time (Days)	Average of Satisfaction Rate	Count of ID Ticket
<30	4.508968377	4.25940902	9645
30-39	4.61650749	4.095154438	31307
40-49	4.655602241	4.050560224	42840
50+	4.119290822	4.158032978	13706
Grand Total	**4.553149808**	**4.100648218**	**97498**

Insights:

Agents aged 50+ demonstrated the best performance, with the lowest average resolution time (4.12 days) and the highest satisfaction score (4.16). On the other hand, the 30–49 group had longer resolution times (4.61–4.65 days) and slightly lower satisfaction (around 4.05), even though they

handled the majority of the tickets. This suggests that while they are the operational backbone, there may be efficiency trade-offs due to high workload or process gaps.

Recommendation:

The data suggests that more experienced agents (50+) provide consistently better service.
To improve overall team performance, the organization could:

- Encourage peer mentoring, pairing senior agents with newer ones
- Consider load balancing across age groups to avoid burnout
- Use these insights for succession planning and skill transfer initiatives

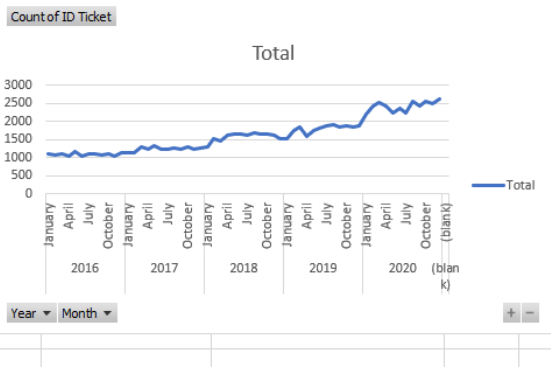
9. Identify the trends for IT support operations based on ticket volumes and satisfaction, and mention the peak and stable times.

Approach:

To uncover trends in IT support operations, we analyzed Monthly ticket volume using a pivot table grouped by Year and Month. Satisfaction scores over time to check for consistency or dips. Resolution times to cross-check whether rising ticket volume impacted performance. This analysis was visualized using a line chart and pivot summaries, which helped identify performance peaks and periods of stability.

Reference:

Row Labels	Count of ID Ticket
2016	**13051**
January	1115
February	1056
March	1105
April	1054
May	1160
June	1051
July	1101
August	1090
September	1061
October	1088
November	1046
December	1124
2017	**14915**
January	1125



Row Labels	Average of Satisfaction Rate
2016	3.979695043
2017	4.068119343
2018	4.091853962
2019	4.122382503
2020	4.161269252

Insights:

The analysis shows a consistent year-on-year increase in ticket volume, with the highest monthly volume recorded in December 2020 (2,609 tickets). This suggests growing dependency on IT support services. Alongside this, satisfaction scores also showed a steady upward trend from 3.97 in 2016 to 4.16 in 2020, which indicates that the IT team was not only handling more tickets but also improving user satisfaction over time. Months like May and June consistently showed moderate volumes, suggesting stable, manageable workloads during those periods. The combination of rising ticket loads

and improving satisfaction suggests operational maturity and effective performance scaling by the support team.

Recommendation:

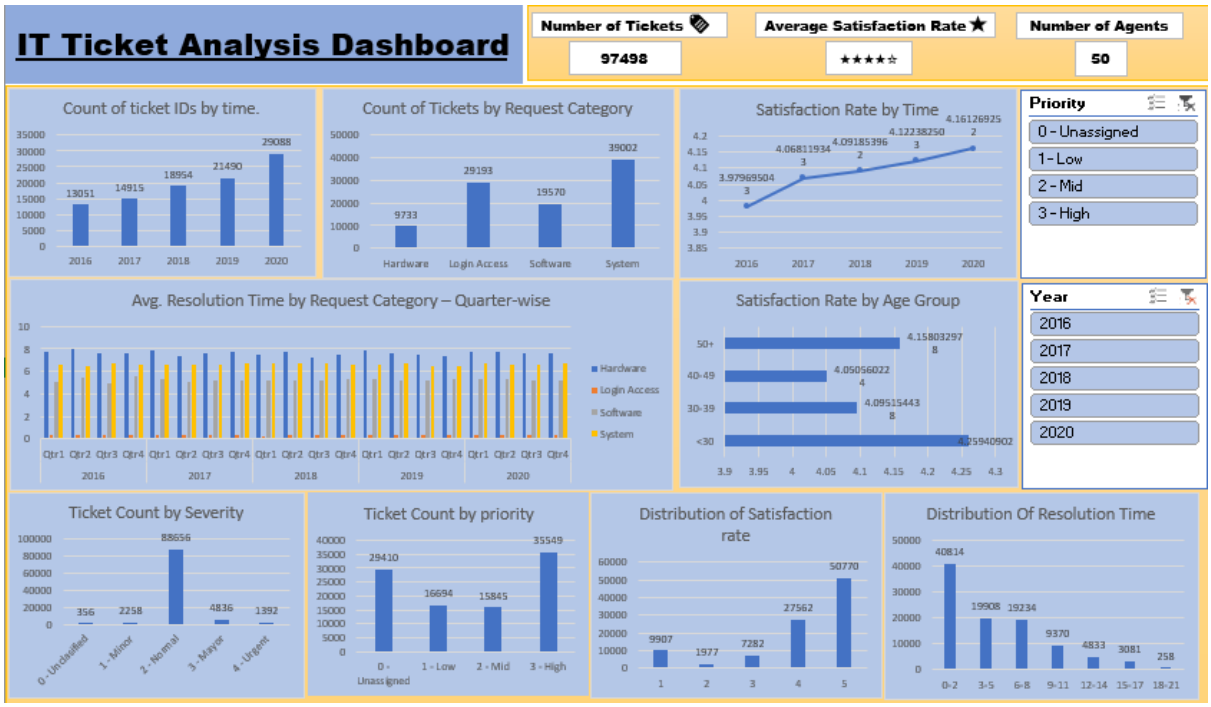
To maintain this positive trend, it's important to plan ahead for known peak periods like year-end months by temporarily increasing staffing or activating workload balancing protocols. Mid-year periods such as May and June, which are historically stable, can be used to conduct agent training, review internal processes, or pilot new tools. Continued focus on maintaining satisfaction even during peak demand will help reinforce user trust and ensure the team sustains performance in a scalable way.

10. What metrics should be included in the final dashboard to provide a comprehensive view of call center performance and guide investment decisions?

Approach:

To design a dashboard that effectively reflects the performance of the IT support team and guides investment decisions, we focused on metrics that represent operational efficiency, customer satisfaction, agent performance, and ticket behavior. The dashboard combines trend analysis, category-level breakdowns, and demographic insights, which help management not just monitor current performance, but also make informed decisions regarding hiring, training, or upgrading tools.

Reference:



Insights:

From the dashboard insights, we observe steady ticket growth over time, particularly after 2018, which indicates increased demand. Categories such as System and Login Access generate higher ticket volumes, while Hardware and System issues take longer to resolve. Certain agents consistently perform well despite handling large volumes, and younger and older age groups show slightly varied satisfaction trends. Severity and priority data highlight possible mismatches in issue urgency assignment, suggesting potential for process refinement.

Recommendation:

IT TICKET ANALYSYS

Based on this, the recommended metrics to include in a robust call center dashboard are: ticket volume trends over time, average resolution time by request category, satisfaction rates by time and agent, agent-wise performance summaries, and ticket distribution by severity and priority. These should be complemented by age group analysis and histograms for both resolution consistency and customer satisfaction. Collectively, these metrics provide a comprehensive and actionable view of IT operations, allowing leadership to strategically invest in staffing, training, or technology upgrades as needed.
